Abstract

The generation of clean energy is crucial to sustainable growth and worldwide environmental concerns caused by climate change. Renewable energy sources have previously demonstrated their low or zero carbon emission generation efficiency. Now, the idea of a microgrid is to have a self-maintained system that consists of numerous energy resources, which can help to operate the microgrid

Dose-Responsive Effect of Sub-acute Lead Exposure on Alteration of Carbohydrate Metabolism in Murine Model

Sudipta Pal

Current Overview on Pharmaceutical Science Vol. 6, 4 February 2023, Page 89-103

<https://doi.org/10.9734/bp/cops/v6/9485F>

View Article Cite Statistics Share

Abstract

The dose-responsive effect of sub-acute lead exposure on carbohydrate metabolism was evaluated. Five groups of Swiss albino male mice were formed; a control group and other lead-treated groups: Group A (5 mg/kg body weight), Group B (10 mg/kg body weight), Group C (15 mg/kg body weight) and Group D (20 mg/kg body weight). Lead exposure caused significant reduction in blood and hepatic glucose levels as well as liver glycogen content in a dose-dependent manner; the most remarkable effect was noted in group D. All of the treated groups experienced a considerable decline in glucose 6-phosphatase activity. Dose-dependent increase in pyruvic acid content was found to be associated with decrease in pyruvate dehydrogenase, malate dehydrogenase and transaminase enzyme activities. Additionally, increased free amino acid nitrogen in liver after lead exposure may provide more substrates for gluconeogenesis. So,

Abstract

An active microvascular condition of diabetes mellitus called diabetic retinopathy (DR) causes blurred vision, floaters, and difficulties seeing colors and sometimes results in permanent vision loss. Clement's cases may be treated with cautious management of diabetes. Advanced cases may need surgery or laser treatment.

I. Introduction

II. Challenges of UWSNs
Communication

Abstract:

Since communications in the Underwater Wireless Sensor Networks (UWSNs) have limited resources and capabilities, designing an efficient and reliable Media Access Control (MAC) protocol for UWSNs faces many challenges. UWSNs have limited bandwidth, power, memory, long propagation delay, high Bit Error Rate (BER), and unreliable communication. Current MAC protocols that have been designed for Terrestrial Wireless Sensor Networks (TWSNs) are not suitable for UWSNs. While the software-based mechanisms promise many benefits to TWSN, four proposed designs introduced MAC protocols based on software-based mechanisms for

Abstract

This paper focuses on the introduction of the interval-valued intuitionistic fuzzy set (IVIFS) and its oscillatory region. This concept is based on the IVIFS and its oscillatory region. The image of dissimilar gray levels cannot be solved by FS, so IFS appeared and then IVIFS is introduced which is more dominant in dealing with

METHODS OF BIOREMEDIATION AND THEIR RECENT ADVANCEMENT FOR ENHANCEMENT OF GREEN AND SUSTAINABLE ENVIRONMENT

Abstract

This article seeks to present an in-depth review of various bioremediation techniques and strategies used to promote the remediation process for the enhancement of sustainable development. Environmental pollution caused by xenobiotics and other associated non-biodegradable substances, which has lately been discovered as a severe hazard to both the natural environment and the health of animals including humans, is one of the main global concerns for human sustainability. Due to industrialization, a variety of pollutants, including plastics,

ABSTRACT

Globally, in recent times one of the most common cancers is lung cancer. Lung cancer is considered an important contributor for death with cancer equally in urban and rural areas. Artificial intelligence algorithms can classify nodules from lung CT images as either benign or malignant. Automated computer-aided diagnosis systems using deep learning algorithms, a subset of artificial intelligence, have established outstanding precision in analysis of images for lung cancer detection. From this study, we can say that computer-aided diagnostics systems not only assist radiologists but pathologists too during screening of patients suffering from lung cancer. But one problem with deep learning is that it is often considered a "black box." To mitigate this, we need explanatory artificial intelligence. In our research work, we have implemented a simple CNN model and the InceptionV3 CNN Model for detection of lung cancer on the IQ-OTH/NCCD and Kaggle open database. We have obtained accuracy of 93.44% with the simple CNN model and 88.83% with the InceptionV3 CNN Model. Some methods, like screening with low-dose chest CT and pulmonary function tests (PFTs), are required for detection of lung cancer in smokers or ex-smokers. The last section of the chapter concludes with the summary of the study.

The background of the cover is a dark, deep blue space filled with a complex network of glowing, multi-colored lines (cyan, magenta, and white) that radiate from a central point, resembling a data visualization or a neural network. Scattered throughout the space are numerous small, bright blue and white particles, some of which are slightly out of focus, creating a sense of depth and movement. The overall aesthetic is futuristic and technological.

Abstract:

Flooding can be really bad for towns and cities around the world. This thesis is about using super smart computer tools to predict floods and warn people in advance. We use a lot of weather data from different locations and try different computer methods to improve our flood predictions. We want to make sure that our predictions are not only accurate but also help communities prepare. We start by looking really closely at our weather data, fixing any problems like missing information or changes in weather
