## RESEARCH INTEREST

Our research is dedicated to exploring the unique microbial communities thriving in the niche environments of the Himalayan region, with a particular emphasis on the North East Himalaya. Currently, we are focused on unlocking the potential of psychrotrophic bacteria for bioprospecting, aiming to leverage the efficient hydrolytic capabilities of psychrotrophic and psychrophilic bacterial communities native to the Himalayas for organic waste degradation in cold, hilly regions.

In addition to this, our laboratory is researching into other crucial aspects of Himalayan microbes. This includes the investigation of probiotics derived from traditional fermented foods and the study of mushrooms, with the goal of enhancing their value and generating sustainable livelihoods for rural populations.

Our work is centered around the following key themes:

- **Understanding Microbial Adaptation:** We study the changes in microbial community composition across different Himalayan glaciers to uncover their adaptational strategies and understand how these microorganisms respond to environmental changes.
- **Bioprospecting for Sustainable Solutions:** We explore bacteria from the alpine regions of the Himalayas, particularly for their potential in organic waste management and the production of industrial enzymes.
- **Mushroom Valorization:** We investigate the enrichment and fortification of mushrooms to add value, with a focus on promoting their use as a sustainable resource for rural communities.
